

Hardware Business Management System

Documentation Package for Project Handoff

Document 01 Project Overview and Vision

Document 02 Business Requirements Document

Document 03 Software Requirements Specification

Architecture Data Model Use Cases Acceptance Criteria and Open Decisions

Prepared on 4 October 2026

Document Control

Item	Value
Project	Hardware Business Management System
Purpose	Create a complete handoff document for Cloud AI or software developers.
Primary outputs	Mobile application and web administration system.
Known roles	Super Admin and Shop Admin.
Prepared date	4 October 2026
Version	Fresh consolidated draft version 1

Status Label Convention

Confirmed means the item is part of the agreed scope. Proposed means it is a recommended implementation detail that can still change. Pending Decision means the business owner must decide before a developer or Cloud AI treats it as final.

Status	Meaning	How developers should treat it
Confirmed	Agreed project requirement or business scope.	Design and implement unless later changed by the owner.
Proposed	Recommended implementation or workflow detail.	Use as a starting point and validate during planning.
Pending Decision	Business rule, accounting rule, policy, or configuration that is not fully decided.	Do not hard code. Ask the owner or make configurable.

Package Contents

Document 01 Project Overview and Vision.

Document 02 Business Requirements Document.

Document 03 Software Requirements Specification.

Initial architecture and integration handoff.

Database and data model requirements.

Use cases and acceptance criteria.

Open decisions and implementation roadmap.

Document 01 Project Overview and Vision

This document defines the business vision and overall scope for a hardware business management system. The system will help the owner manage multiple hardware shops through a mobile application and a web administration platform. The core purpose is to make daily operations, stock movement, sales, expenses, capital, debts, profit tracking, reporting, and auditability easier to control.

Project Vision

The vision is to build a reliable business management platform that can work in a shop environment even when internet access is unstable. Shop users should be able to record transactions quickly from the mobile application. The owner or central administrator should be able to supervise shops, review reports, monitor stock, and inspect financial activity through the web administration interface.

Business Problem

- Stock, sales, purchases, expenses, capital, and debts can become difficult to track when multiple shops are involved.
- Manual records make it hard to know daily profit, business performance, debt exposure, and available capital.
- Internet interruptions can block cloud-only systems from being useful at the exact time a shop needs to record a transaction.
- The business needs audit trails so changes, deletions, approvals, and corrections can be traced to a specific user and time.

Confirmed Scope Summary

Area	Requirement	Status
Platforms	Mobile application plus web administration system.	Confirmed
Roles	Super Admin and Shop Admin must be supported.	Confirmed
Product records	Products, categories, buying price, selling price, stock quantity, and related details must be managed.	Confirmed
Purchases	Purchases must increase stock and support supplier and cost tracking.	Confirmed
Sales	Sales must reduce stock and support profit calculation.	Confirmed
Expenses	Business expenses must be recorded and reflected in reports.	Confirmed
Capital	Business capital must be tracked.	Confirmed
Debts	Customer or business debts must be tracked.	Confirmed
Daily operation	Daily opening and daily closing must be supported.	Confirmed
Offline storage	Mobile app must use SQLite locally and synchronize with MySQL when online.	Confirmed
Reports	Reports are required for sales, stock, profit, expenses, capital, debts, and daily closing.	Confirmed
Security	Role-based access, login security, and audit trail are required.	Confirmed

Out of Scope for First Build

Item	Status	Notes
E-commerce customer shopping portal	Proposed	Can be considered later if the business wants online customer ordering.
Full payroll management	Proposed	Basic staff/user records may exist, but payroll is not part of the confirmed first scope.
Tax filing automation	Pending Decision	Tax and VAT logic must be defined before automation.
Bank integration	Proposed	Manual capital and payment records are enough for the first build unless integration is requested.

Document 02 Business Requirements Document

This BRD describes what the business needs the system to achieve. It focuses on business processes, roles, controls, and decisions that must be clear before implementation. It intentionally does not confirm accounting formulas that have not yet been approved by the business owner.

Business Objectives

Objective	Business Value	Status
Central business visibility	The owner can see performance across all shops from the web admin.	Confirmed
Fast shop recording	Shop Admin can record sales, purchases, expenses, stock changes, and debts from the mobile app.	Confirmed
Reliable offline use	Shop transactions can continue during internet interruptions.	Confirmed
Financial discipline	Profit, capital, expenses, debts, and 60/40 allocation can be tracked consistently.	Confirmed
Auditability	Every critical action can be traced for accountability.	Confirmed
Growth readiness	The design can support multiple shops and future features.	Confirmed

Stakeholders and Roles

Role	Responsibilities	Access Status
Super Admin	Owens system setup, shop setup, users, reports, stock visibility, approvals, audit review, and business configuration.	Confirmed
Shop Admin	Records day-to-day shop activity including sales, purchases, stock, expenses, debts, and daily closing.	Confirmed
Supplier	External party linked to purchases and payables if supplier debt is enabled.	Proposed
Customer	External buyer linked to credit sales and debt repayment if customer accounts are enabled.	Proposed
Developer or Cloud AI	Uses this document to generate implementation plans, screens, database schema, API routes, and test cases.	Confirmed

Core Business Processes

Process	Business Requirement	Status
Daily opening	A shop day should be opened before daily transactions are recorded or reconciled.	Confirmed
Product setup	Products should be created with category, unit, buying price, selling price, opening stock, and status.	Confirmed
Purchase recording	Purchases should capture supplier, product, quantity, unit cost, total cost, payment status, and date.	Confirmed

Process	Business Requirement	Status
Sales recording	Sales should capture product, quantity, unit price, discount if enabled, payment status, and customer if needed.	Confirmed
Stock movement	Stock should increase through purchases and approved adjustments, and decrease through sales and approved adjustments.	Confirmed
Expense recording	Expenses should capture category, amount, shop, date, reason, and user.	Confirmed
Capital tracking	Capital injections, withdrawals, and balance movement should be visible.	Confirmed
Debt tracking	Debts should show who owes, amount, due date if used, repayments, and outstanding balance.	Confirmed
Profit review	Profit should be calculated and reported, but the final formula must be confirmed by the owner.	Pending Decision
60/40 allocation	The system must support a 60 percent and 40 percent financial allocation rule after profit is determined.	Confirmed
Daily closing	End-of-day totals should summarize sales, expenses, debts, cash, stock exceptions, and notes.	Confirmed

Key Business Rules

Rule ID	Rule	Status
BR-001	A user must log in before accessing any shop or business data.	Confirmed
BR-002	A Shop Admin can only access assigned shop data unless the owner grants broader access.	Confirmed
BR-003	A sale should not reduce stock below zero unless negative stock is explicitly enabled.	Proposed
BR-004	Any manual stock adjustment must capture reason, user, date, and before or after quantity.	Confirmed
BR-005	Purchase entries increase stock only after they are saved or approved according to configuration.	Confirmed
BR-006	Credit sales or debts must update outstanding balance and repayment history.	Confirmed
BR-007	The exact profit formula must be approved before development treats it as final.	Pending Decision
BR-008	The 60/40 allocation should be applied after profit is finalized for a defined period.	Pending Decision
BR-009	Expense categories and whether each category reduces profit must be configured or approved.	Pending Decision
BR-010	Cost valuation method for stock and profit, such as latest cost, average cost, or FIFO, must be decided.	Pending Decision

Business Reports Required

- Daily sales report by shop, product, payment method, and user.
- Stock report showing current quantity, low stock, stock value, and movement history.
- Purchase report by supplier, product, date, shop, and payment status.
- Expense report by category, shop, date, and user.
- Debt report showing outstanding balances, repayments, overdue items if due dates are used, and related customer or supplier.
- Profit report showing revenue, cost, expenses, gross profit, net profit if defined, and allocation results.
- Daily closing report comparing expected totals against recorded totals and notes.
- Audit report showing user actions, changes, deletions, logins, sync events, and approvals.

Document 03 Software Requirements Specification

This SRS translates the business requirements into software requirements for design and development. Each requirement includes an identifier, platform target, status, and acceptance expectation so a developer or Cloud AI can generate tasks, screens, APIs, database schema, and tests from it.

Product Perspective

The system consists of a mobile application, a web administration interface, a backend API, a central MySQL database, a local SQLite database on mobile, and a synchronization layer. The mobile application is expected to work in the shop during normal operations. The web admin is expected to provide central control, reports, configuration, and oversight.

User Classes

User Class	Description	Primary Platform	Status
Super Admin	Business owner or central administrator with full control over shops, users, configuration, reports, and audit trail.	Web and mobile where appropriate	Confirmed
Shop Admin	Shop-level user who records transactions and performs daily opening and closing for assigned shop.	Mobile first, web where appropriate	Confirmed
Future Accountant	Optional user who may review financial records without full system control.	Web	Proposed

Functional Requirements

ID	Module	Requirement	Platform	Status	Acceptance
FR-001	Authentication	Users must log in securely before accessing system data.	Mobile Web	Confirmed	Invalid credentials are rejected and successful login opens only authorized data.
FR-002	Password reset	The system should support secure password reset or admin-initiated password reset.	Web Mobile	Proposed	A user can regain access without exposing passwords.
FR-003	Role permissions	The system must enforce Super Admin and Shop Admin permissions.	Web Mobile	Confirmed	Shop Admin cannot access unauthorized shop or admin-only configuration.
FR-004	Shop management	Super Admin must create, edit, deactivate, and view shops.	Web	Confirmed	A shop can be managed without deleting historical records.
FR-005	User management	Super Admin must create users, assign roles, assign shops, deactivate users, and review user status.	Web	Confirmed	Assigned users can access only the correct shop and features.
FR-006	Product categories	The system must manage product categories for hardware products.	Web Mobile	Confirmed	Products can be grouped and filtered by category.
FR-007	Product records	The system must manage product name, SKU or code, unit, category, buying price, selling price, reorder level, and active status.	Web Mobile	Confirmed	Product details can be added, edited, searched, and deactivated.
FR-008	Purchase recording	The system must record purchases with product, quantity, unit cost, supplier if used, shop, date, payment status, and notes.	Mobile Web	Confirmed	Saved purchase increases stock and appears in purchase reports.
FR-009	Supplier records	The system should maintain supplier contacts where purchases and supplier debts are used.	Web Mobile	Proposed	Supplier can be linked to purchases and filtered in reports.
FR-010	Sales recording	The system must record sales with product, quantity, unit price, discount if enabled, payment method, customer if needed, date, and user.	Mobile Web	Confirmed	Saved sale reduces stock and appears in sales reports.
FR-011	Receipt support	The system should generate a printable or shareable sales receipt.	Mobile Web	Proposed	Receipt includes shop, date, items, totals, payment details, and sale reference.
FR-012	Stock balance	The system must show current stock by product and shop.	Mobile Web	Confirmed	Stock balance changes after purchases, sales, and adjustments.
FR-013	Stock adjustment	The system must allow authorized stock adjustments with reason and audit trail.	Web Mobile	Confirmed	Adjustment records before quantity, after quantity, user, time, and reason.
FR-014	Low stock alert	The system must notify authorized users when product stock reaches reorder level.	Mobile Web	Confirmed	Low stock products appear in alerts and reports.
FR-015	Expense recording	The system must record expense category, amount, date, shop, payment method if used, user, and reason.	Mobile Web	Confirmed	Expenses appear in daily closing and expense reports.
FR-016	Expense categories	Super Admin must manage expense categories.	Web	Confirmed	Categories can be added, edited, deactivated, and used in expenses.

ID	Module	Requirement	Platform	Status	Acceptance
FR-017	Capital entries	The system must record capital injections, withdrawals, and capital balance movement.	Web Mobile	Confirmed	Capital report shows opening, movement, and current capital balance.
FR-018	Debt records	The system must record debts, repayments, outstanding balances, party name, shop, date, and notes.	Mobile Web	Confirmed	Repayment reduces outstanding balance and debt history remains visible.
FR-019	Customer records	The system should maintain customer records for credit sales and debt follow-up.	Mobile Web	Proposed	Customer can be linked to sales, debts, and repayments.
FR-020	Profit calculation	The system must calculate profit once the owner approves the formula and cost method.	Web Mobile	Pending Decision	Profit output matches the approved formula in test cases.
FR-021	60 40 allocation	The system must support a 60 percent and 40 percent allocation after profit is finalized.	Web Mobile	Confirmed	Allocation can be generated for a selected period, with exact accounts pending decision.
FR-022	Daily opening	A Shop Admin must be able to open a business day for a shop.	Mobile Web	Confirmed	Transactions are associated with the active business day.
FR-023	Daily closing	A Shop Admin must be able to close a business day with totals, notes, and exceptions.	Mobile Web	Confirmed	Closing report stores totals and prevents silent editing without audit trail.
FR-024	Offline storage	The mobile app must store transactions locally in SQLite when offline.	Mobile	Confirmed	A transaction can be saved without internet and marked for sync.
FR-025	Synchronization	The mobile app must synchronize local SQLite data with central MySQL when online.	Mobile Backend	Confirmed	Pending records sync successfully and sync status is visible.
FR-026	Conflict handling	The system must detect sync conflicts and resolve them through approved rules.	Backend Mobile Web	Pending Decision	Conflict cases are logged and not silently overwritten.
FR-027	Notifications	The system must notify authorized users about low stock, sync failures, daily closing reminders, and important debt events.	Mobile Web	Confirmed	Relevant notifications appear to the correct users.
FR-028	Reports	The system must provide sales, purchases, stock, expenses, debts, capital, profit, daily closing, and audit reports.	Web Mobile	Confirmed	Reports can be filtered by date, shop, user, product, and category where relevant.
FR-029	Export	The system should export selected reports to PDF or spreadsheet format.	Web	Proposed	A filtered report can be exported for business review.
FR-030	Audit trail	The system must log critical create, update, delete, login, sync, approval, and closing actions.	Backend Web	Confirmed	Audit log shows actor, action, time, before or after values where relevant, and device/source.
FR-031	Settings	Super Admin must configure business name, shops, categories, roles, permissions, stock thresholds, and financial rule settings.	Web	Confirmed	Settings changes are saved and audited.
FR-032	Search and filters	The system must support search and filtering for products, sales, purchases, debts, reports, and audit logs.	Web Mobile	Confirmed	Users can find records quickly by common criteria.
FR-033	Data backup	The system should support backup and restore procedures for central data.	Backend	Proposed	Backup process is documented and tested before production.
FR-034	Record correction	The system must support corrections without destroying audit history.	Web Mobile	Confirmed	Corrections are linked to the original record or logged in audit trail.

Non Functional Requirements

ID	Category	Requirement	Status
NFR-001	Availability	Mobile shop operations must continue offline for core transaction recording.	Confirmed
NFR-002	Performance	Common mobile actions such as product search and sale entry should respond quickly under normal shop data volume.	Proposed
NFR-003	Security	Passwords must be hashed, sessions must expire, and access must be role based.	Confirmed
NFR-004	Privacy	Sensitive user and business data must be visible only to authorized users.	Confirmed
NFR-005	Reliability	Synchronization must retry failed records and preserve a visible sync status.	Confirmed
NFR-006	Integrity	Stock, sales, purchases, debts, expenses, and capital records must preserve referential integrity.	Confirmed
NFR-007	Usability	Shop screens must be optimized for fast entry with minimal typing where possible.	Confirmed
NFR-008	Maintainability	The codebase should separate mobile, web, backend, sync, and reporting responsibilities.	Proposed
NFR-009	Scalability	The design should support multiple shops and growing product and transaction volume.	Confirmed

ID	Category	Requirement	Status
NFR-010	Auditability	Critical changes must remain traceable after correction or synchronization.	Confirmed

Validation Requirements

- Required fields must be validated before saving records.
- Quantities, prices, costs, expenses, repayments, and capital values must be numeric and non-negative unless a correction workflow allows otherwise.
- Selling below cost may be blocked or warned depending on owner decision.
- A sale should validate available stock unless negative stock is enabled.
- Dates must be valid and assigned to the correct business day.
- Duplicate product codes should be blocked or resolved before saving.
- Offline records must have stable local identifiers so they can synchronize safely later.

Error Handling Requirements

- Network failures must not delete or corrupt local mobile data.
- Failed sync records must remain visible with retry status.
- Users should receive clear messages for validation errors, permission errors, and sync failures.
- Server errors must be logged for administrators without exposing sensitive technical details to Shop Admin users.
- Duplicate sync submissions must be detected to avoid double counting sales, purchases, expenses, repayments, or stock adjustments.

Document 04 Initial Architecture and Technical Handoff

This section gives an initial implementation direction. Architecture details are proposed unless they restate confirmed business scope. Developers may adjust the technology stack, but they should preserve the offline-first mobile requirement, central MySQL synchronization, role security, and auditability.

System Components

Component	Purpose	Status
Mobile application	Daily shop operations, offline SQLite storage, sales, purchases, expenses, debts, stock, daily opening and closing.	Confirmed
Web admin	Central administration, user and shop management, reports, settings, audit review, and oversight.	Confirmed
Backend API	Authentication, authorization, business rules, data validation, reporting, synchronization, and audit logging.	Proposed
SQLite local database	Offline storage on mobile devices.	Confirmed
MySQL central database	Central persistent data store for all shops and reports.	Confirmed
Sync service	Transfers pending mobile data to central database and retrieves approved updates from server.	Confirmed
Notification service	Delivers alerts for stock, debt, sync, daily closing, and administrative events.	Confirmed

Platform Feature Parity

Feature Area	Mobile App	Web Admin	Status
Login and role access	Yes	Yes	Confirmed
Product lookup	Yes	Yes	Confirmed
Product setup	Yes if allowed	Yes	Confirmed
Sales entry	Yes	Yes if allowed	Confirmed
Purchase entry	Yes	Yes	Confirmed
Expenses	Yes	Yes	Confirmed
Capital	Yes if allowed	Yes	Confirmed
Debts and repayments	Yes	Yes	Confirmed
Daily opening and closing	Yes	Yes for review and correction	Confirmed
Reports	Basic operational reports	Full reports and exports	Confirmed
User and permission setup	No	Yes	Confirmed
Audit review	Limited own-shop visibility if allowed	Full visibility	Confirmed
Offline mode	Yes	No	Confirmed

Synchronization Principles

- Mobile records created offline should be saved first in SQLite with a local unique identifier and pending sync status.
- When online, the app should push pending records to the backend API and receive central identifiers after successful sync.
- The backend should reject invalid, duplicate, unauthorized, or conflicting records with clear error codes.
- Each synced record should keep source device, user, shop, local creation time, server receive time, and sync status.
- Conflict resolution for the same record changed in more than one place must be decided before implementation is finalized.

Security Controls

Control	Requirement	Status
Authentication	All users must authenticate before using the system.	Confirmed
Authorization	Every API and screen must check role, shop assignment, and permission.	Confirmed
Password storage	Passwords must be hashed with a modern secure algorithm.	Confirmed
Transport security	Production traffic should use HTTPS.	Confirmed
Audit logs	Critical business events must be logged.	Confirmed
Device control	Mobile devices may need registration or revocation for high-risk environments.	Proposed
Data encryption	Local SQLite encryption should be evaluated for devices storing sensitive business data.	Proposed

Document 05 Data Model and Database Requirements

This section lists core data entities and relationships for implementation planning. It is not a final physical schema. Developers should turn it into a normalized database design, migration files, API contracts, and SQLite sync tables.

Core Entities

Entity	Purpose	Important Fields	Status
Business	Stores owner business profile.	name, contact, currency, settings	Confirmed
Shop	Represents each hardware shop or branch.	business id, shop name, location, active status	Confirmed
User	Stores system users.	name, phone or email, password hash, role, status	Confirmed
Role Permission	Controls allowed features.	role, permission code, allowed flag	Confirmed
Product Category	Groups products.	category name, active status	Confirmed
Product	Stores hardware product information.	name, code, unit, category, cost, selling price, reorder level, status	Confirmed
Stock Balance	Stores current quantity by shop and product.	shop id, product id, quantity, updated at	Confirmed
Stock Movement	Stores every stock increase or decrease.	product, shop, type, quantity, source record, before and after quantity	Confirmed
Purchase	Stores purchase header.	supplier, shop, date, total, payment status, user	Confirmed
Purchase Item	Stores purchased products.	purchase id, product, quantity, unit cost, line total	Confirmed
Sale	Stores sale header.	shop, customer, date, total, payment method, payment status, user	Confirmed
Sale Item	Stores sold products.	sale id, product, quantity, unit price, cost basis, line total	Confirmed
Expense	Stores business expenses.	shop, category, amount, date, user, reason	Confirmed
Capital Entry	Stores capital injections and withdrawals.	shop or business, type, amount, date, reason	Confirmed
Debt	Stores customer or supplier debt.	party, type, original amount, balance, due date, status	Confirmed
Debt Payment	Stores repayments.	debt id, amount, payment date, method, user	Confirmed
Daily Session	Stores daily opening and closing.	shop, business date, opening data, closing data, status	Confirmed
Profit Allocation	Stores 60/40 allocation outputs.	period, profit amount, 60 amount, 40 amount, destination labels	Confirmed
Notification	Stores system alerts.	type, recipient, message, read status, related record	Confirmed
Audit Log	Stores critical actions.	actor, action, entity, record id, before value, after value, timestamp	Confirmed
Sync Queue	Tracks offline mobile changes.	local id, entity, payload, sync status, retries, error	Confirmed

Important Data Rules

Data Rule	Status
Every transaction should belong to a shop and a user.	Confirmed
Soft deletion or deactivation should be used for business records that have transaction history.	Proposed
Stock movement should be append-only so stock history remains auditable.	Confirmed
Audit logs should not be editable by normal users.	Confirmed
Profit records should store the formula version or configuration used to calculate them.	Proposed
60/40 allocation records should store the source profit period and approved profit amount.	Confirmed
Mobile sync records should preserve local creation time and server synchronization time.	Confirmed

Accounting Decisions Required Before Final Schema

Decision	Why It Matters	Status
Profit formula	Determines whether profit means gross profit, net profit, cash profit, or another business-specific measure.	Pending Decision
Stock cost method	Determines cost of goods sold and profit for products bought at different prices.	Pending Decision
Expense treatment	Determines which expenses reduce profit and which are tracked separately.	Pending Decision
Debt categories	Determines whether customer debt, supplier debt, owner debt, and business debt are separate modules or one configurable module.	Pending Decision
60/40 destination labels	Determines what the 60 percent and 40 percent amounts represent in reports.	Pending Decision
Allocation timing	Determines whether 60/40 is applied daily, weekly, monthly, or after owner approval.	Pending Decision
Tax or VAT handling	Determines invoice fields, tax reports, and profit calculation.	Pending Decision

Document 06 Use Cases Workflows and Acceptance Criteria

This section describes the main user workflows and acceptance criteria that can become test cases. The goal is to give developers a practical view of how the system should behave when used in a real shop.

Primary Use Cases

Use Case	Actor	Main Flow	Acceptance Criteria
Open business day	Shop Admin	Select shop, confirm date, enter opening notes or cash if required, open day.	System creates an active daily session and records user and time.
Record sale	Shop Admin	Search product, add quantity, confirm price, choose payment status or method, save sale.	Stock decreases, sale is stored, audit is logged, and report totals update.
Record purchase	Shop Admin	Select supplier if used, add product and quantity, enter cost, save purchase.	Stock increases and purchase appears in purchase and stock movement reports.
Record expense	Shop Admin	Choose category, amount, reason, date, payment method if used, save.	Expense appears in daily closing and expense reports.
Record debt	Shop Admin	Enter party, amount, type, due date if used, notes, and save.	Debt balance appears in debt report and can accept repayments.
Close business day	Shop Admin	Review totals, stock exceptions, unpaid debts, expenses, notes, and close day.	Daily closing report is saved and later corrections are audited.
Review business reports	Super Admin	Choose report type, filters, and date range.	Report shows accurate filtered data and can export if export is enabled.
Manage users	Super Admin	Create user, assign role and shop, activate or deactivate access.	User permissions take effect immediately and are audited.
Synchronize offline data	Mobile App	Detect internet, upload pending records, download approved updates.	Pending records become synced or display actionable sync errors.

General Acceptance Checklist

Area	Acceptance Criteria	Status
Login	Only valid users can access the system and permissions match assigned role.	Confirmed
Shop restriction	Shop Admin sees only assigned shop data.	Confirmed
Product management	Products can be created, searched, edited, deactivated, and linked to stock.	Confirmed
Sales	Sales reduce stock and appear in sales, profit, and daily closing reports.	Confirmed
Purchases	Purchases increase stock and appear in purchase and stock reports.	Confirmed
Expenses	Expenses appear in expense reports and daily closing.	Confirmed
Capital	Capital movement is recorded and visible in reports.	Confirmed
Debts	Debt balances and repayments are accurate and traceable.	Confirmed

Area	Acceptance Criteria	Status
Profit	Profit calculation matches owner-approved formula.	Pending Decision
60/40	Allocation matches owner-approved timing and destination labels.	Pending Decision
Offline mode	Mobile app saves core transactions without internet.	Confirmed
Sync	Offline records synchronize without duplicates when internet returns.	Confirmed
Audit trail	Critical actions show who did what, when, and from which source.	Confirmed
Reports	Reports can be filtered by shop and date, with accurate totals.	Confirmed
Validation	Invalid records are blocked with clear messages.	Confirmed
Error handling	Network and server errors do not cause data loss.	Confirmed

Definition of Done for First Release

- Super Admin can manage shops, users, roles, products, categories, reports, settings, and audit trail.
- Shop Admin can record daily operational activities on mobile and use offline mode for core transactions.
- SQLite to MySQL synchronization works with visible sync status and duplicate prevention.
- Daily opening and closing are usable and produce a reviewable daily report.
- Sales, purchases, expenses, debts, capital, stock, and reports operate consistently across assigned shops.
- Security, permissions, validation, audit trail, and error handling are tested before production use.
- Pending accounting decisions are resolved or made configurable before final launch.

Document 07 Open Decisions and Implementation Roadmap

This final section lists decisions the owner should confirm before detailed development. It also gives a practical implementation roadmap so the project can move from documentation into design, development, testing, and launch.

Open Decisions

Decision ID	Open Decision	Recommended Handling	Status
OD-001	Final profit formula.	Confirm before coding reports, allocation, and dashboards.	Pending Decision
OD-002	Stock cost method for profit.	Choose latest cost, weighted average, FIFO, or another approved method.	Pending Decision
OD-003	Meaning of 60 percent and 40 percent amounts.	Define labels, destination accounts, and whether values are cash or accounting allocations.	Pending Decision
OD-004	Timing of 60/40 allocation.	Decide daily, weekly, monthly, per closing, or after owner approval.	Pending Decision
OD-005	Expense categories that reduce profit.	Mark each category as profit-reducing or informational.	Pending Decision
OD-006	Customer debt and supplier debt model.	Decide if both are needed in first release and how each should be reported.	Pending Decision
OD-007	Returns, refunds, discounts, and damaged goods.	Define workflows before final sales and stock design.	Pending Decision
OD-008	Negative stock policy.	Decide whether to block, warn, or allow with permission.	Pending Decision
OD-009	Sync conflict policy.	Define conflict rules for edited offline records and server changes.	Pending Decision
OD-010	Tax, VAT, and invoice requirements.	Confirm whether tax calculations are part of first release.	Pending Decision

Decision ID	Open Decision	Recommended Handling	Status
OD-011	Receipt printing method.	Decide printer type, paper size, Bluetooth support, or shareable PDF receipt.	Pending Decision
OD-012	Supported languages and currency.	Confirm UI language, report language, and currency formatting.	Pending Decision

Implementation Roadmap

Phase	Main Work	Exit Criteria
Phase 1 Discovery closure	Confirm open accounting and operational decisions.	Owner approves rules needed for development.
Phase 2 UX and workflow design	Design mobile shop workflows and web admin screens.	Clickable screens or approved wireframes are ready.
Phase 3 Database and API design	Create MySQL schema, SQLite schema, sync contracts, and API routes.	Schema and API contracts pass review.
Phase 4 Core build	Build authentication, shops, users, products, purchases, sales, stock, expenses, debts, capital, audit.	Core modules work in development environment.
Phase 5 Offline sync	Implement local SQLite queue, sync retry, duplicate prevention, and conflict handling.	Offline and online test cases pass.
Phase 6 Reports and financial rules	Build reports, profit calculation, and 60/40 allocation after owner approval.	Report totals match approved test cases.
Phase 7 Testing	Run functional, security, sync, validation, error, and acceptance tests.	Critical defects are fixed and owner signs off.
Phase 8 Pilot and launch	Deploy to a small shop group, train users, monitor issues, then expand.	Pilot is stable and production launch is approved.

Handoff Prompt for Cloud AI or Developer

Use this documentation package as the source of truth for the Hardware Business Management System. Generate implementation plans, UI screens, data models, API specifications, test cases, and development tasks from confirmed requirements. Treat proposed items as recommended but changeable. Treat pending decisions as unresolved and ask the owner before hard coding accounting, profit, allocation, tax, debt, stock costing, or sync conflict rules.
